

# Effects of the ISIS Recommender System for navigation support in self-organised Learning Networks

## Citation for published version (APA):

Drachler, H., Hummel, H., Van den Berg, B., Eshuis, J., Waterink, W., Nadolski, R., Berlanga, A., Boers, N., & Koper, R. (2008). *Effects of the ISIS Recommender System for navigation support in self-organised Learning Networks*.

## Document status and date:

Published: 05/06/2008

## Document Version:

Peer reviewed version

## Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

# Effects of the ISIS Recommender System for navigation support in self-organised Learning Networks

Hendrik Drachsler, Hans Hummel, Bert van den Berg, Jannes Eshuis, Wim Waterink, Rob Nadolski, Adriana Berlanga, Nanda Boers and Rob Koper

Open University of the Netherlands

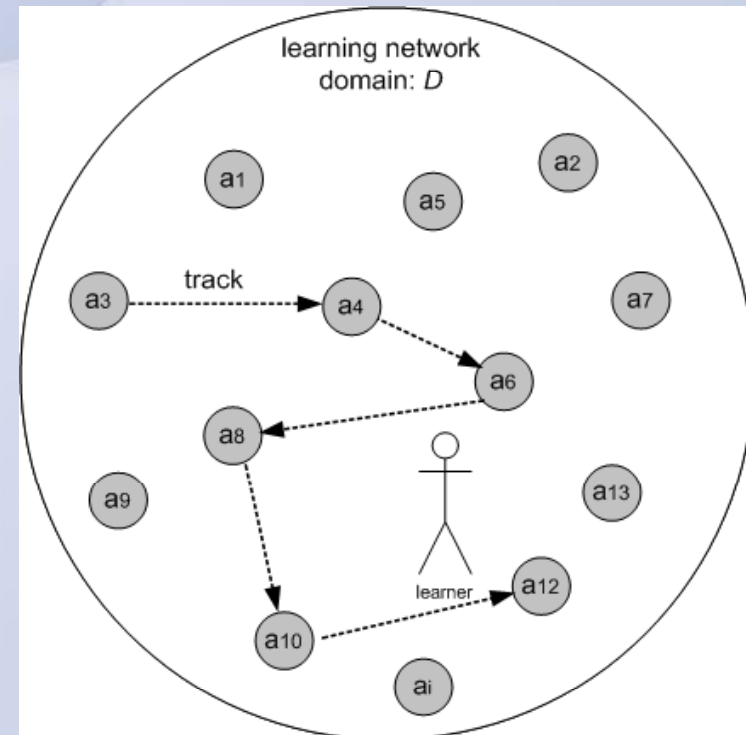

**TEN** Competence

Building The European Network for Lifelong Competence Development

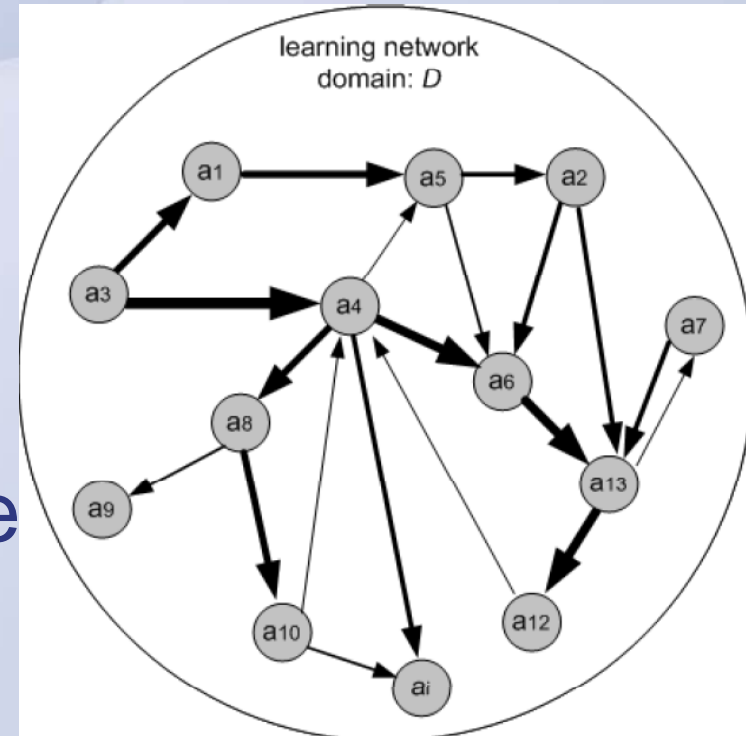

# Learning Networks?

- Learners can publish their own Learning Activities (LAs)
- Learners can share, rate, tag and adjust LAs from others
- Explicitly address informal learning

# Self-organisation in Learning Networks

- A Learning Network *emerge* from the bottom upwards (versus top down systems)
- Learners create a large amount of Learning Activities (LAs) and behavioural data over time

# Nowadays, Recommender systems supporting our decisions

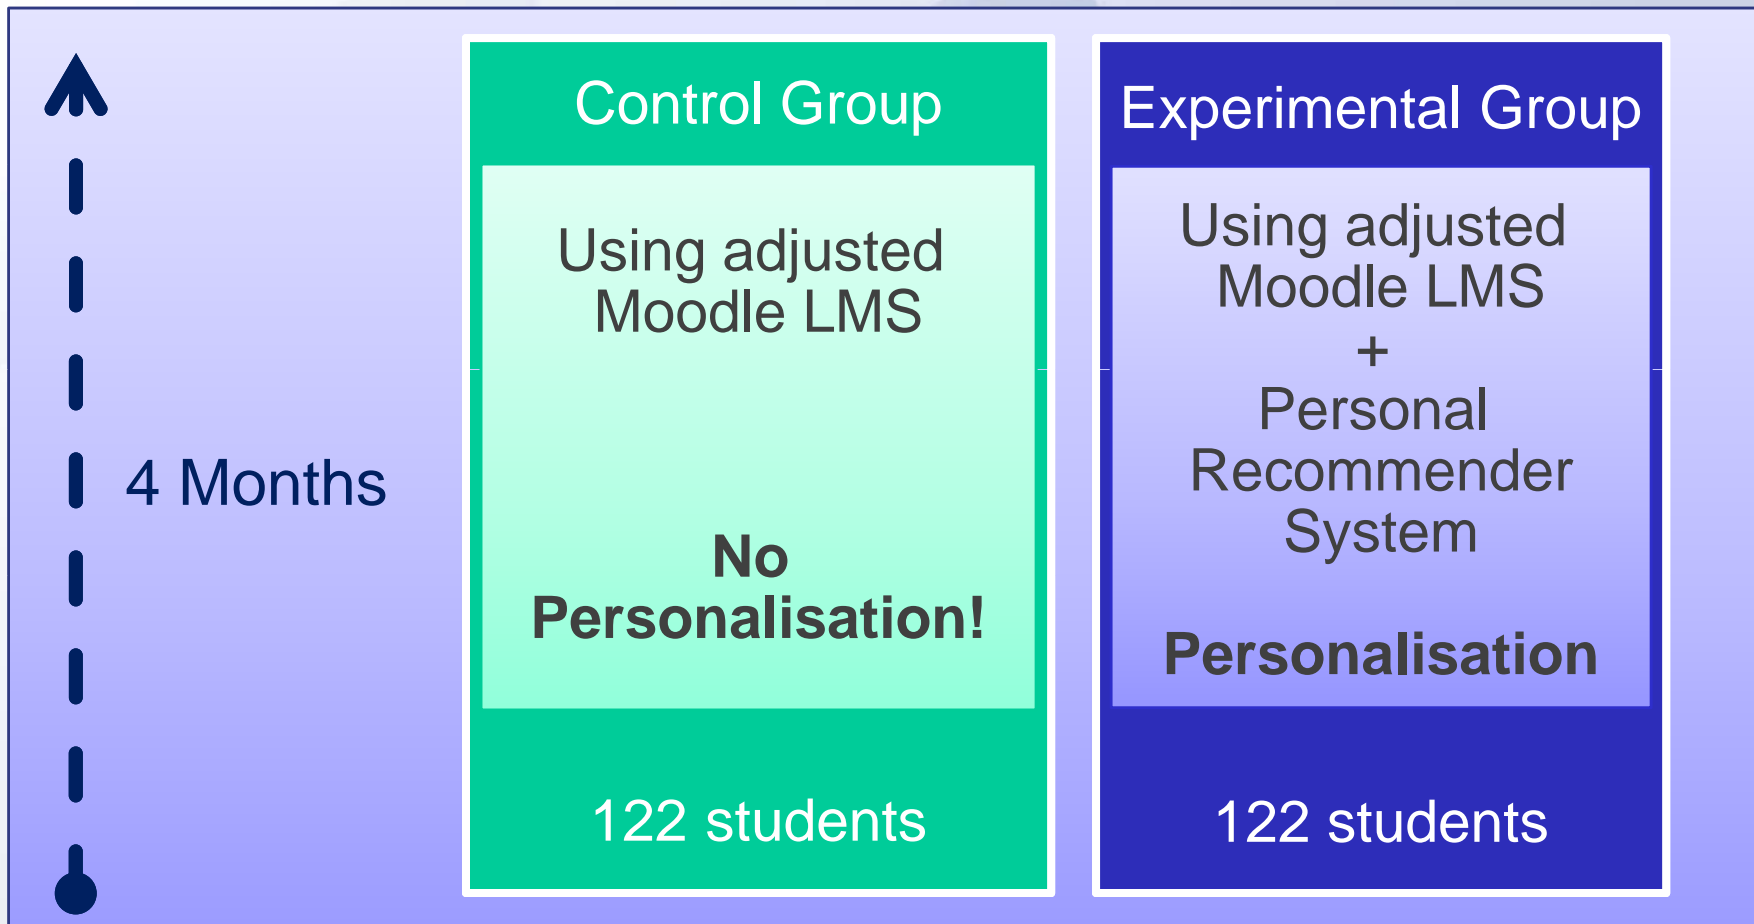

# Navigation support for informal Learning Networks

- Should enable more personalised learning paths
- Should take into account pedagogical issues and available Learning Activities for recommendations

# Experimental Design

# Participants

- 244 participants subscribed to this pilot.
- Randomly allocated to control and experimental group (122 learners per group).
- 24 participants (19.7%) in the experimental group and 30 participants (24.5%) in the control group never logged into the Moodle environment.
- This leaves a group of 190 learners who did enter the Moodle environment; 98 in the experimental and 92 in the control group.

PRS Recommendation

# The adjusted Moodle Environment

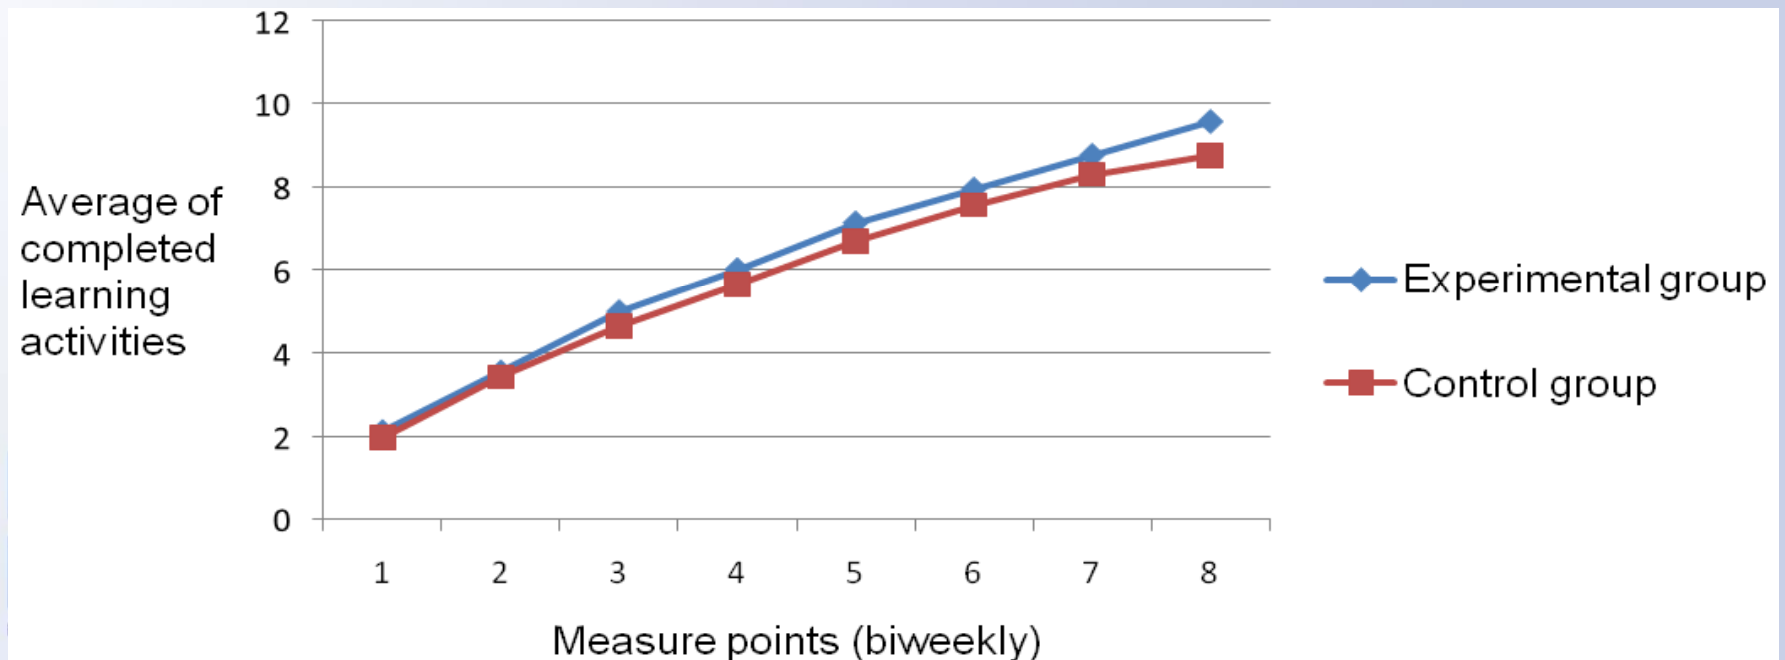

Overview of learning activities		
<p><b>You already completed:</b> You have not completed any learning activity.</p>	<p><b>Activities you are enrolled into:</b> Perception Personality Awareness Changes during the life time Therapies Language</p>	<p><b>You still need to complete:</b> Behavior and health Thinking Social Psychology Conditioning and learning Abnormal psychology Recall and neglect Intelligence The biology of behavior Motivation and emotions Attention and awareness Applied Psychology</p>
 <p>Based on your study interest in "<b>cognition</b>" (mentioned in your personal profile), we suggest to further study the following learning activity:</p>		
<p><b>Title of the suggested learning activity</b></p>	<p><b>Options</b></p>	
<p>Thinking</p>	<p>description of the recommendation   <a href="#">adjust profile</a></p>	

# Hypotheses

1. The experimental group will be able to complete more LAs than the control group (**Effectiveness**).
2. The experimental group will complete LAs in less time, because alignment of learner and LA characteristics will increase the efficiency of the learning process (**Efficiency**).
3. The experimental group has a broader variety of learning paths than the control group because the PRS supports more personalised navigation (**Variety**).
4. The experimental group will be satisfied with the navigational support of the PRS (**Satisfaction**).

# Results / Effectiveness

- The experimental group was consistently found to be more effective in completing LAs than the control group during the experimental period.
- But we have not found a significant difference; therefore, hypothesis 1 cannot be confirmed.

# Results / Efficiency

- The experimental group consistently needed less time to complete equal amounts of LAs
- This effect was found to reach significance after 4 months. Therefore, hypothesis 2 could be confirmed.

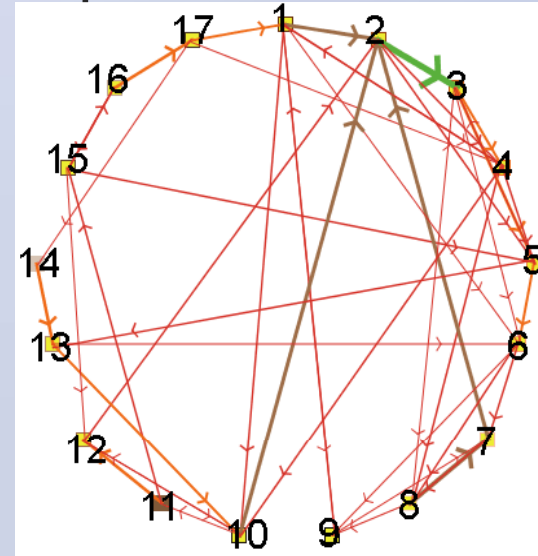

# Results / Variety

- The variety of personalised learning paths increased by the PRS. The experimental group from the beginning onward created more personalised learning paths.
- The experimental group made more ties between the Learning Activities in the Learning network, thus we confirm hypothesis 3.

Control group

Experimental Group

# Results / Satisfaction

- 64% of the participants used the PRS over the whole experimental period very often or often.
- 46% have the impression that the PRS helped them to organise their learning progress in a more personalised way.
- The experimental group was more satisfied with the recommendations based on stereotype filtering.
- Because of the positive responses from the learners and actual usage data we can confirm hypothesis 4.

**TEN Competence**

Building The European Network for Lifelong Competence Development

# Limitations

- The practical character of the experiment, embedded in a formal course with real students excluded some of the navigational problems faced by lifelong learners.
- Elapsed study time as measured through the Moodle environment is only an assistant indicator for real study time.
- We decide to show only the ‘best next LA’, instead of a list or a sequence with suitable recommendations.

**TEN Competence**

Building The European Network for Lifelong Competence Development

# Conclusions

Despite the limitations of the presented study, it partially proves that the use of navigation support based on a personalised recommendation strategy offers a promising way to advise learners on their self-organisation in Learning Networks.

**TEN Competence**

Building The European Network for Lifelong Competence Development

# Future research

- Regarding the informal characteristic of Learning Networks, we want to use more bottom-up techniques like collaborative filtering instead of top-down ontologies. In future research we are planning to use explicit ratings and tags given by the learners.
- Currently, we are running series of simulations in Netlogo where we test the impact of additional recommendation techniques for different sizes of LNs.

Many thanks for your interest!
