Theoretical background - 3R study strategy

Optimizing the 3R Study-Strategy for Text Learning (1)

SUPPORTNet

3R

Recite, Review
Recite, Review
Recite, Review

A more significant and efficient way to study

Read

- Read a passage, term, or concept that you need to memorize
- Remember to CHUNK study time, don't cram

Verbatim, multiple-fact Questions
-
Free recall
-
Rereading

Review

- Read the passage, term, or concept that you need to memorize *again*
- Make notes of any information you couldn't recall

READ, RECITE, REVIEW

The 3R Method had been shown to improve performance, relative to re-reading only and note taking. SAVE TIME – Use the 3R Method when you are exercising, waiting in line, walking to class, and so on.

Adapted from the Read-Recite-Review Study Strategy: Effective and Portable
McDaniel, Howard and Eixstein (Psychological Science, 2009)

Optimizing the 3R Study-Strategy for Text Learning (2)

- Q1: Answering verbatim, multiple-fact questions in the recite phase → better performance on the **same multiple-fact questions** after a one week delay as compared to performing free recall and rereading the text?
- Q2: Retrieval of information in the recite phase by answering verbatim, multiple-fact questions or free recall → better performance on **single-fact questions** in the final test after a one week delay as compared to rereading the text?
- Q3: Retrieval of information in the recite phase by answering verbatim, multiple-fact questions or free recall → better performance on **transfer questions** in the final test after a one week delay as compared to rereading the text?

Optimizing the 3R Study-Strategy for Text Learning (3)

- Results: for our research questions we did not find significant results.
- Conclusion: survey on 'deep approaches to learning' shows that learners often do not apply deep learning strategies, which seems to correspond with our findings and findings of other researchers among university students (Karpicke, Butler, & Roediger, 2009) and secondary school students (Dirkx, 2014).

Retrieval by Verbatim Multiple-Fact Questions or Free Recall (1)

Retrieval by Verbatim Multiple-Fact Questions or Free Recall (2)

- Q1: Answering single-fact or multiple-fact post-questions during reading → enhances the immediate retention of the questioned information?
- Q2: Alignment between answering single-fact or multiple-fact post-questions during reading and answering single-fact or multiple-fact questions after reading respectively → enhances the delayed retention of the questioned information?
- Q3: Question-based guidance → enhances the delayed retrieval of non-questioned information?

Retrieval by Verbatim Multiple-Fact Questions or Free Recall (3)

After reading:

- Answering verbatim, single-fact questions (SS condition) or verbatim, multiple-fact questions (MM condition) in the read phase → significantly better recall of idea units on the same single-fact or multiple fact questions in the recite phase as compared to the other conditions
- Participants in the free recall condition retrieved more non-questioned information as compared to participants in the other conditions

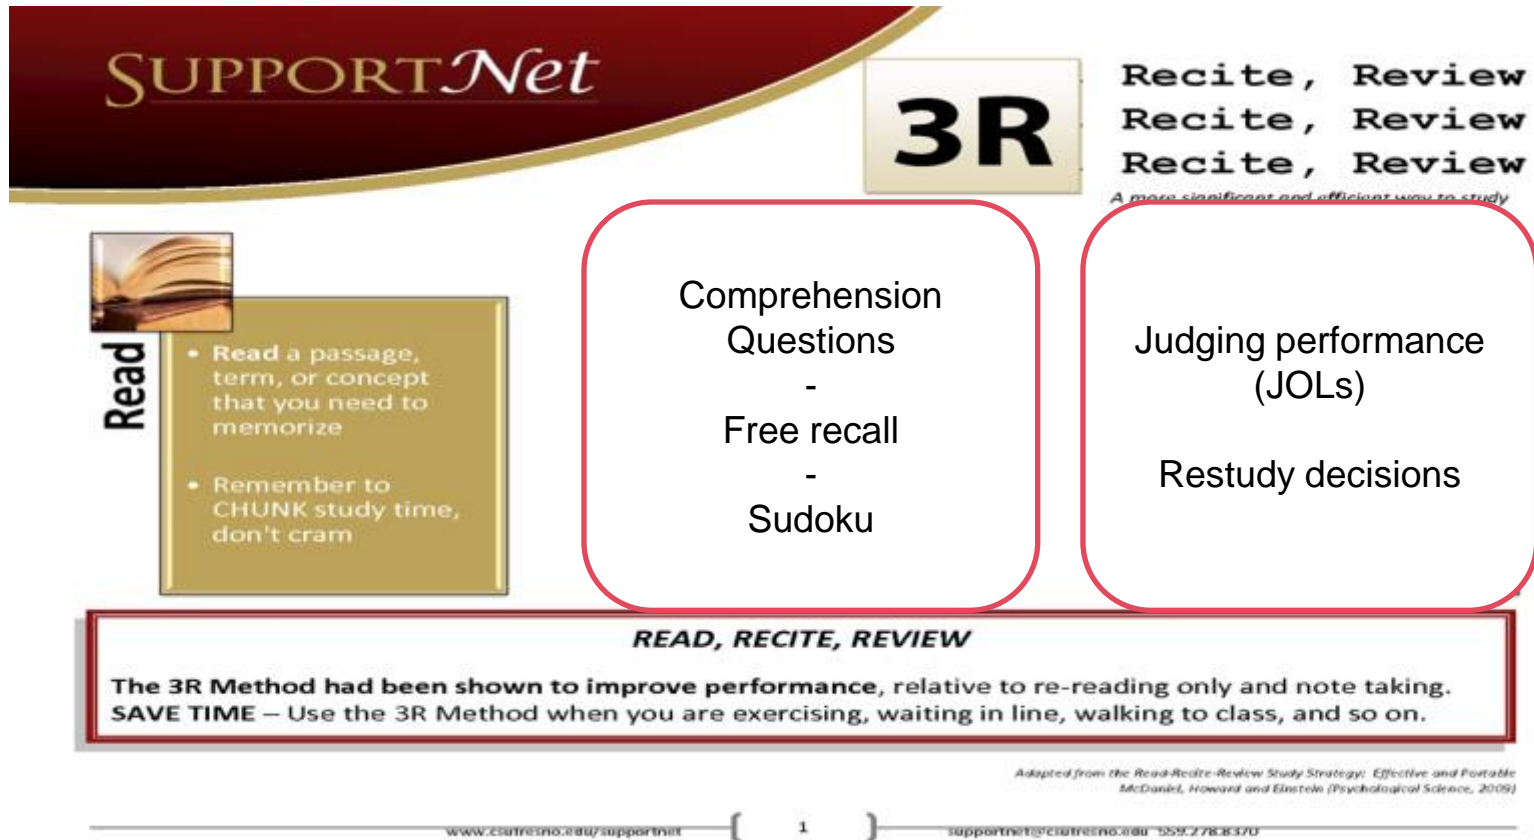

Retrieval by Verbatim Multiple-Fact Questions or Free Recall (4)

Final test:

- Answering single-fact or multiple-fact questions in the read and recite phases → better retrieval of the idea units for **repeated** questions on the final test compared to answering different types of questions in the read phase and the recite phase or performing free recall in the recite phase
- No significant main effect of condition on retrieved idea units for completely new information (not earlier retrieved during the recite phase) belonging to the subset of **new verbatim, single-fact questions** in the final test
- A significant main effect of condition on retrieved idea units for completely new information (not earlier retrieved during the recite phase) belonging to the subset of **new verbatim, multiple-fact questions** in the final test.

The Effect of Different Study-Strategies on the Monitoring Accuracy of Text Learning (1)

www.csatresno.ou.nl/supportnet { 1 } supportnet@csatresno.ou.nl 559.278.8370

The Effect of Different Study-Strategies on the Monitoring Accuracy of Text Learning (2)

- Judgments:
 - How do you think you will perform on a test if questions on text text section <title> are offered?
- Restudy decisions:
 - Which text sections do you want to restudy?
- Next steps:
 - Calculating correspondence between judgments and test performance
 - Calculating correspondence between judgments and restudy decisions
 - ANOVA's to investigate the differences between the three conditions
 - Investigating how much information is retrieved during the recite phase and final test

Last Study

- Content depends on our findings of the study conducted at Bernardinus college
- Possible examples:
 - Altering study strategies? Offering more or less guidance?
 - Creating expectancies: if you know you have to teach a student after studying, does this change your performance and judgments?
 - ...
